

Divide and Conquer

Divide and Conquer

- A problem solving approach / technique / strategy / paradigm.
 - Recursive in nature,
 - involves **three** steps:
- **Divide** the problem into a number of *subproblems*.
 - **Conquer** the *subproblems* by solving them **recursively**.

Base case:

If the subproblem sizes are small enough,
just solve them.

- **Combine** the *solutions to the subproblem* into the solution for the original problem.

Running Time: Divide and conquer

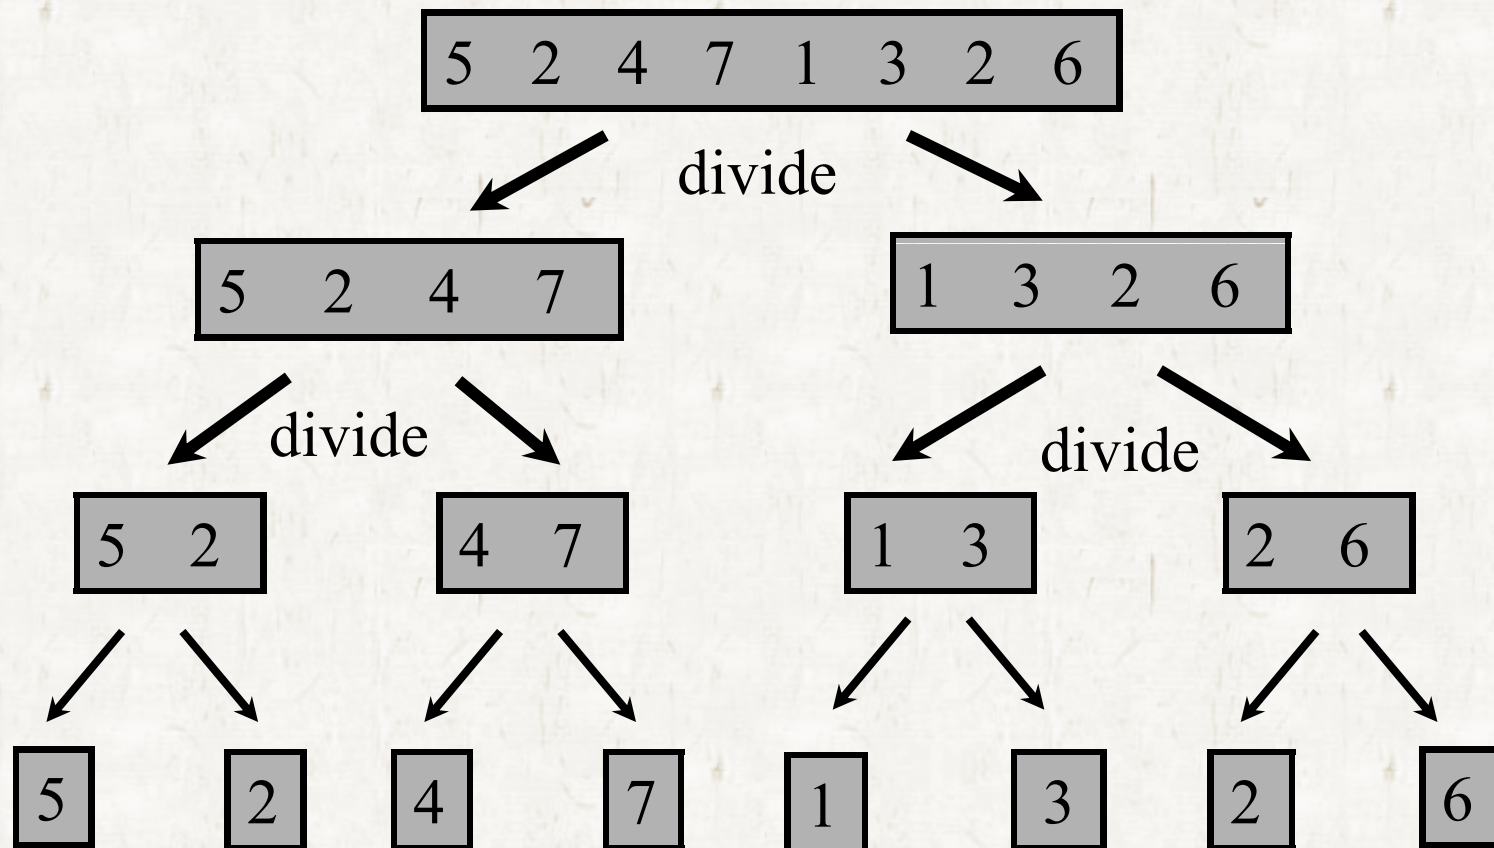

- Suppose that our division of the problem yields a subproblems, each of which is $1/b$ the size of the original.
 - We shall see many divide-and-conquer algorithms in which $a \neq b$.
- Let $D(n)$ denote time to divide the problem into subproblems.
- Let $C(n)$ denote time to combine the solutions to the subproblems into the solution to the original problem.
- We get the recurrence

$$T(n) = \begin{cases} \Theta(1) & \text{if } n \leq c, \\ aT(n/b) + D(n) + C(n) & \text{otherwise.} \end{cases}$$

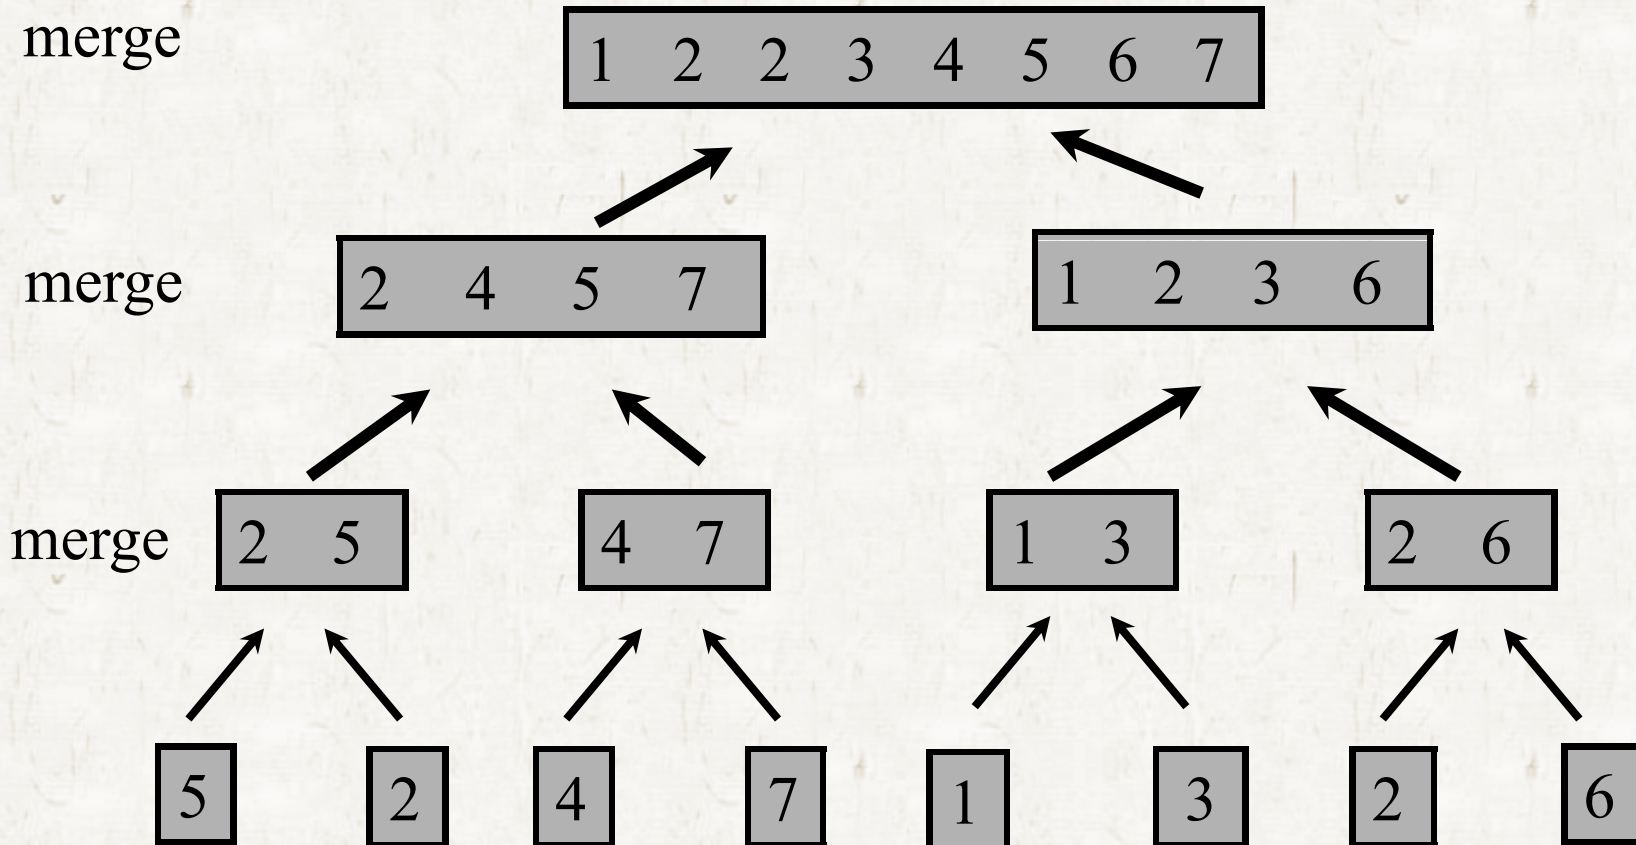

Merge Sort

- A sorting algorithm based on divide and conquer.
- **Divide** by splitting into **two subarrays**
 $A[p .. q]$ and $A[q+1 .. r]$,
where q is the halfway point of $A[p .. r]$.
- **Conquer** by **recursively sorting** the two subarrays
 $A[p .. q]$ and $A[q+1 .. r]$.
- **Combine** by **merging** the two sorted subarrays
 $A[p .. q]$ and $A[q+1 .. r]$
to produce a single sorted array $A[p .. r]$.

Merge sort: Divide Scenario

Merge sort: Merge Scenario

Merge sort: Merge Operation

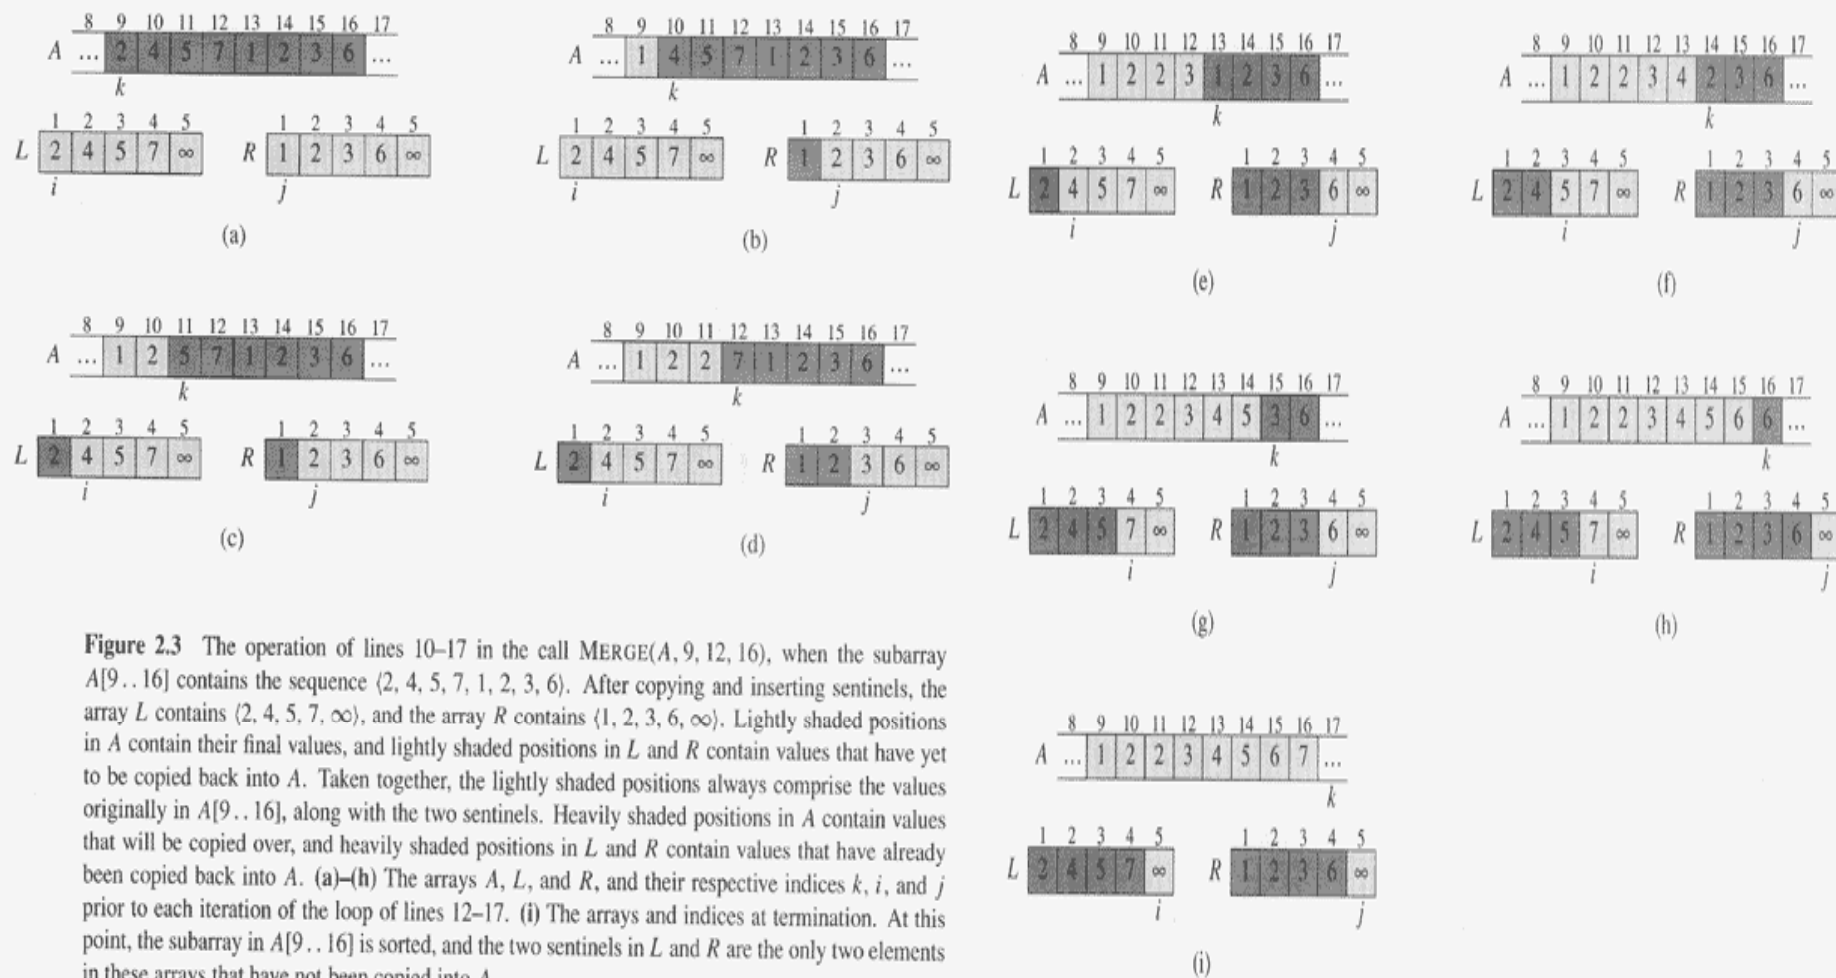

Figure 2.3 The operation of lines 10–17 in the call `MERGE(A, 9, 12, 16)`, when the subarray $A[9..16]$ contains the sequence $\langle 2, 4, 5, 7, 1, 2, 3, 6 \rangle$. After copying and inserting sentinels, the array L contains $\langle 2, 4, 5, 7, \infty \rangle$, and the array R contains $\langle 1, 2, 3, 6, \infty \rangle$. Lightly shaded positions in A contain their final values, and lightly shaded positions in L and R contain values that have yet to be copied back into A . Taken together, the lightly shaded positions always comprise the values originally in $A[9..16]$, along with the two sentinels. Heavily shaded positions in A contain values that will be copied over, and heavily shaded positions in L and R contain values that have already been copied back into A . (a)–(h) The arrays A , L , and R , and their respective indices k , i , and j prior to each iteration of the loop of lines 12–17. (i) The arrays and indices at termination. At this point, the subarray in $A[9..16]$ is sorted, and the two sentinels in L and R are the only two elements in these arrays that have not been copied into A .

Pseudo code: Merge Procedure

MERGE(A, p, q, r)

```
1   $n_1 \leftarrow q - p + 1$ 
2   $n_2 \leftarrow r - q$ 
3  create arrays  $L[1 .. n_1 + 1]$  and  $R[1 .. n_2 + 1]$ 
4  for  $i \leftarrow 1$  to  $n_1$ 
5      do  $L[i] \leftarrow A[p + i - 1]$ 
6  for  $j \leftarrow 1$  to  $n_2$ 
7      do  $R[j] \leftarrow A[q + j]$ 
8   $L[n_1 + 1] \leftarrow \infty$ 
9   $R[n_2 + 1] \leftarrow \infty$ 
10  $i \leftarrow 1$ 
11  $j \leftarrow 1$ 
12 for  $k \leftarrow p$  to  $r$ 
13     do if  $L[i] \leq R[j]$ 
14         then  $A[k] \leftarrow L[i]$ 
15              $i \leftarrow i + 1$ 
16         else  $A[k] \leftarrow R[j]$ 
17              $j \leftarrow j + 1$ 
```

Line 1-3 and 8-11 takes constant time and for loop takes $\Theta(n_1+n_2)$ time

Execute $r-p+1$ times

Pseudo code: Merge sort Procedure

MERGE-SORT(A, p, r)

1 **if** $p < r$

2 **then** $q \leftarrow \lfloor (p + r)/2 \rfloor$

3 MERGE-SORT(A, p, q)

4 MERGE-SORT($A, q + 1, r$)

5 MERGE(A, p, q, r)

Running time : Merge sort (1)

- **Divide:** $D(n) = \Theta(1)$

- The divide step just computes the middle of the subarray, which takes constant time.

- **Conquer:** $2T(n/2)$ [$a = b = 2$].

- We recursively solve two subproblems, each of size $n/2$.

- **Combine:** $C(n) = \Theta(n)$

- We have already showed that merging two sorted lists of size $n/2$ takes $\Theta(n)$ time.

Running time : Merge sort (2)

- $D(n)+C(n) = \Theta(1) + \Theta(n) = \Theta(n)$
- $T(n)$ can be represented as a recurrence.

$$T(n) = \begin{cases} \Theta(1) & \text{if } n=1, \\ 2T(n/2) + \Theta(n) & \text{if } n > 1 \end{cases}$$

Running time : Merge sort (3)

$$T(n) = \begin{cases} \Theta(1) & \text{if } n=1, \\ 2T(n/2) + \Theta(n) & \text{if } n > 1 \end{cases}$$

$$T(n) = \begin{cases} c & \text{if } n=1, \\ 2T(n/2) + cn & \text{if } n > 1 \end{cases}$$

- Where the constant c represents the time required to solve problems of size 1 as well as the time per array element of the divide and combine steps.

Running time : Merge sort (4): Recursion tree

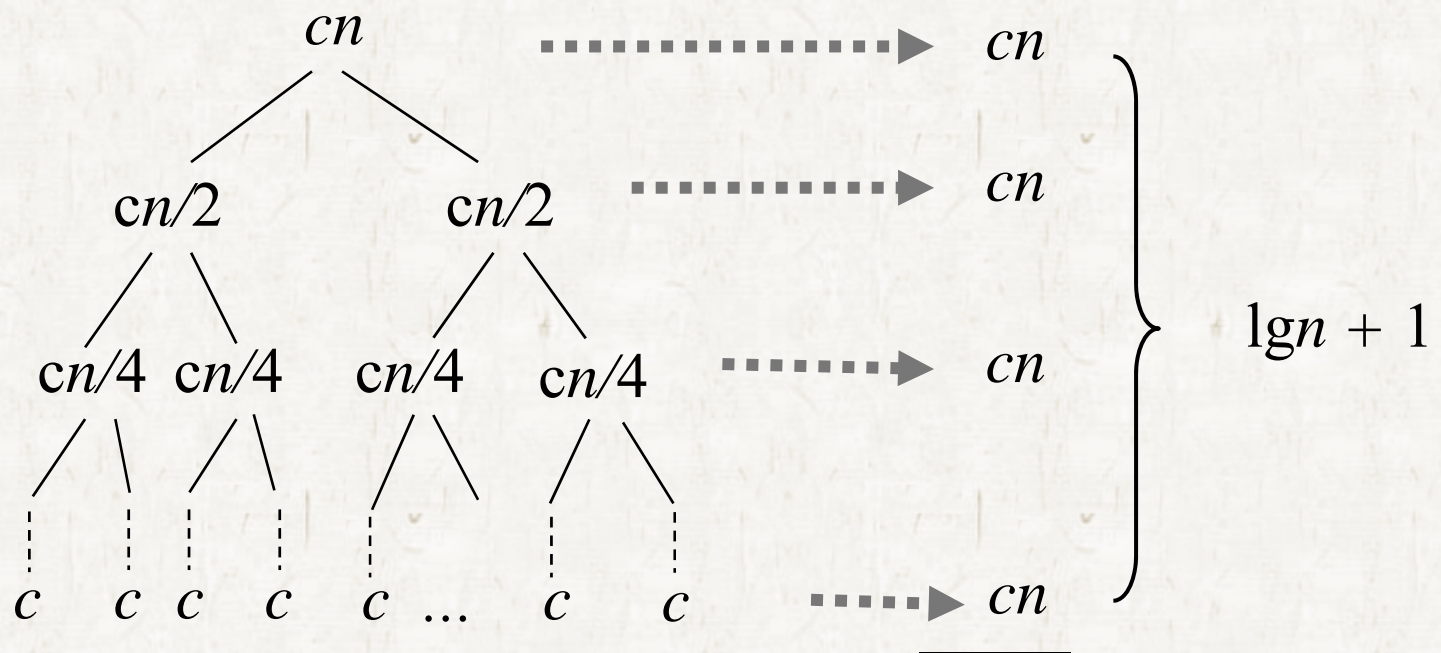

Running time : Merge sort (5): Recursion tree

Running time : Merge sort (6): Recursion tree

Running time : Merge sort (7): Recursion tree

Total : $cn \lg n + cn = \Theta(n \lg n)$

Running time : Merge sort (8): Substitution

$$T(n) = \begin{cases} \Theta(1) & \text{if } n=1 \\ 2T(n/2) + \Theta(n) & \text{if } n>1 \end{cases} = \begin{cases} c & \text{if } n=1 \\ 2T(n/2) + cn & \text{if } n>1 \end{cases}$$

Solution :

$$\begin{aligned} T(n) &= 2T(n/2) + cn \\ &= 2\left\{2T\left(\frac{n}{2^2}\right) + c\frac{n}{2}\right\} + cn \\ &= 2^2T\left(\frac{n}{2^2}\right) + cn + cn \\ &= 2^2T\left(\frac{n}{2^2}\right) + 2cn \\ &= 2^2\left\{2T\left(\frac{n}{2^3}\right) + c\frac{n}{2^2}\right\} + 2cn \\ &= 2^3T\left(\frac{n}{2^3}\right) + cn + 2cn \\ &= 2^3T\left(\frac{n}{2^3}\right) + 3cn \\ &\vdots \\ &= 2^kT\left(\frac{n}{2^k}\right) + kcn \\ &= nT(1) + cn \lg n \\ &= cn + cn \lg n \quad [T(1) = c] \\ &= \Theta(n \lg n). \end{aligned}$$

$$\begin{aligned} \frac{n}{2^k} &= 1 \\ n &= 2^k \\ \lg n &= \lg 2^k = k \\ \therefore k &= \lg n \end{aligned}$$

Thank You
